HANDSMEN THREADS: ELEVATING THE ART OF SOPHISTICATION IN MEN'S FASHION

User Story

HandsMen Threads is a menswear business that wants shopping to feel smooth and personal for every customer, while its own operations run efficiently behind the scenes. Customers like to look through men's fashion products, find out whether an item is available, order it, get a confirmation, and hear about what happens to their purchase afterwards. For sales staff, the need is a central system holding customer details and orders, along with each customer's purchase history, which lets them give better service. Inventory managers have to work with accurate, current stock numbers so shortages are avoided and restocking happens on time. Marketing staff turn customer information and past purchases into effective campaigns and better engagement. Administrators and managers, meanwhile, want reports and dashboards that show customers, products, orders, inventory, and marketing activity in one view. Salesforce ties all of this together on a single platform and takes over important business processes through automation.

1. INTRODUCTION

1.1 Project Overview:

HandsMen Threads is a premier fashion and menswear brand handling diverse product lines, from tailored apparel to seasonal accessories. To scale operations and retain customers, maintaining accurate data flow and seamless inventory oversight is critical.

Manual data entry errors, limited stock visibility, and disconnected customer touchpoints risked inventory stockouts, processing delays, and diminished client trust.

Implemented a centralized platform featuring UI data integrity enforcement, automated post-order email confirmations, and dynamic loyalty tier updates based on purchase history.

Integrated proactive low-stock alerts below five units and scheduled midnight batch jobs for bulk orders, ensuring accurate inventory levels, balanced financial records, and reliable executive reporting.

The solution uses **Custom Objects, Validation Rules, Lightning App Builder, Record-Triggered Flows, Apex, and Asynchronous Apex**.

1.2 Purpose:

The purpose of the HandsMen Threads Order Management System is to streamline fashion retail workflows, safeguard data integrity, and elevate customer relationships.

The system aims to:

- Ensure data integrity directly from the UI to eliminate manual entry errors.
- Centralize customer profiles, purchase history, and apparel product data.
- Enhance real-time inventory visibility across warehouse and retail channels.
- Trigger proactive stock alerts whenever inventory falls below five units.
- Automate post-order email confirmations to strengthen customer engagement.
- Drive repeat purchases through a dynamic, purchase-based loyalty program.
- Automate daily midnight bulk order processing for accurate financial records and inventory reconciliation.
- Secure sensitive customer, financial, and inventory data through role-based access controls.
- Establish an extensible, scalable Salesforce foundation for future business growth.

2. IDEATION PHASE

The ideation phase focused on identifying core operational bottlenecks across customer data, orders, inventory, loyalty, and finance. Through structured problem identification, empathy mapping, brainstorming, clustering, and impact-feasibility prioritization, high-value solutions were established to eliminate manual effort, enforce data integrity, boost customer engagement, and streamline operational control.**Key Ideas Identified**

• **Centralized Customer Management:** Hold customer information and order history together on one platform.

• **Order Management:** Manage customer orders efficiently, covering order status, quantities, payments, and delivery details.

• **Inventory Management:** Follow product stock and let the system pick out low-stock products automatically.

• **Automated Notifications:** Automatically email order confirmations, payment notices, delivery updates, and stock alerts.

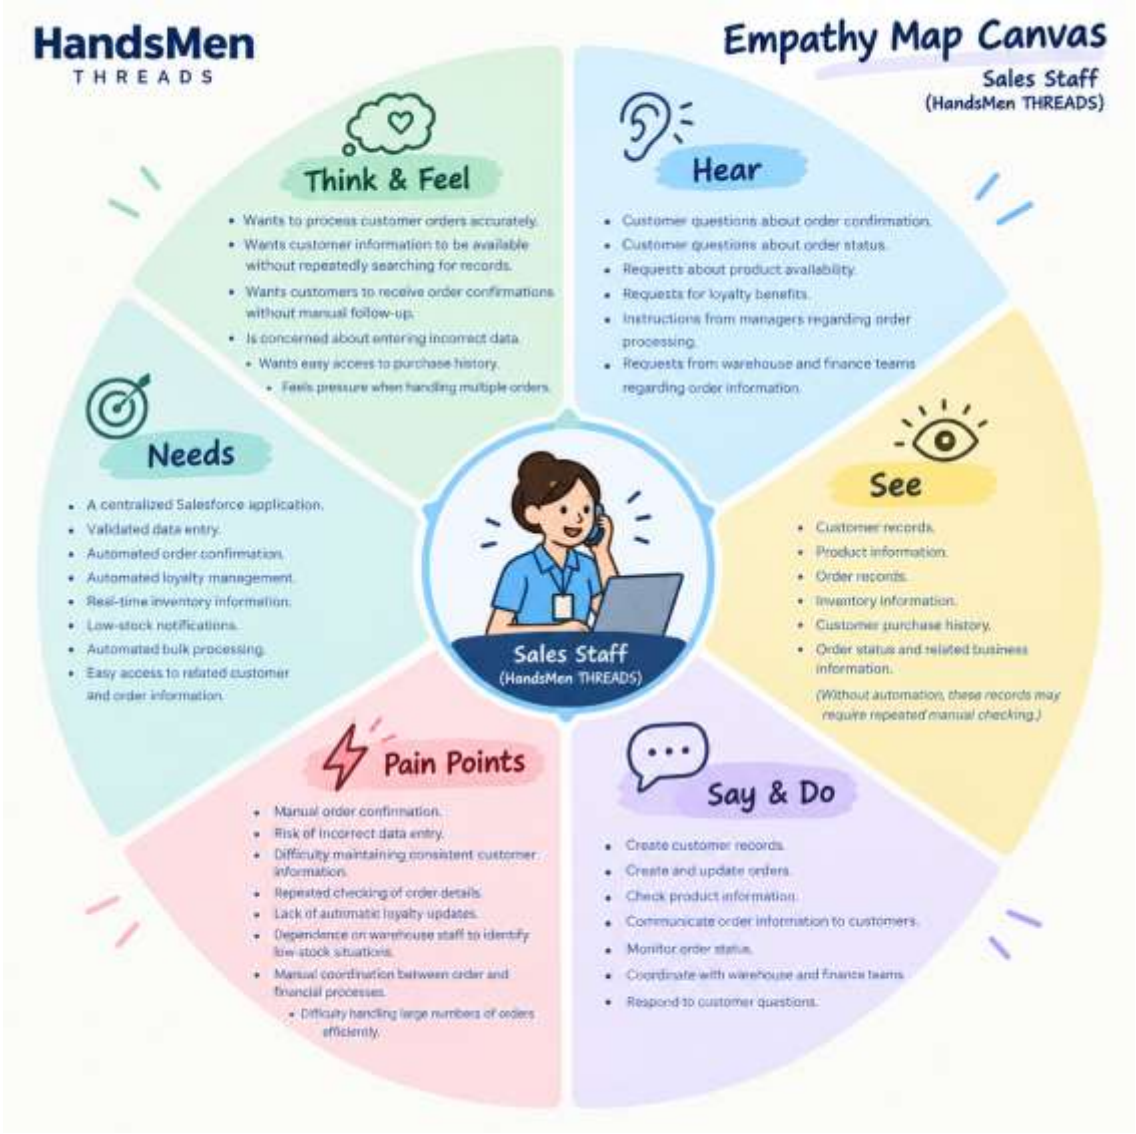

• **Data Validation:** Prevent incorrect product, order, and inventory data through validation rules.

• **Role-Based Security:** Let each user see only the customer, product, order, and inventory information their role calls for.

2.1 Problem statement

PS	User	I'm trying to	But	Because
PS-1	Customer	Get confirmation once an order has been placed	Updates about the order may rely on manual communication	There is no automated confirmation process
PS-2	Sales Staff	Keep customer and order information correct	Information may be entered incorrectly or incompletely	Data entry is not controlled well enough
PS-3	Customer	Be recognized suitably for buying again and again	Loyalty status might not update on its own	Purchase history is not evaluated on a continuous basis
PS-4	Warehouse Team	Keep an eye on stock levels of products	Low stock may not get noticed straight away	Checking stock may have to be done manually
PS-5	Finance Team	Keep financial information about orders accurate	Bulk order processing may call for manual updates again and again	Order and financial processing is not completely automated
PS-6	Administrator	Process large order volumes efficiently	Bulk processing can eat up a lot of time	Handling orders one by one is inefficient

2.2 Empathy Map Canvas

2.3 Brainstorming & Idea Prioritization

Several ways of tackling the business problems that had been identified were looked at during brainstorming.

Step 1: Brainstormed Ideas

Architectural Options Considered

- Approach A: Decentralized Spreadsheet Tracking
    - Concept: Manage customer profiles, apparel lines, warehouse counts, and sales ledgers across shared sheets.
    - Trade-off: Minimal initial overhead, but prone to human error, lack of data integrity controls, zero real-time inventory synchronization, and heavy manual burden.
- Approach B: Manual Outreach & Ad-Hoc Operations
    - Concept: Sales reps draft and dispatch confirmation emails manually following every purchase.
    - Trade-off: High communication latency, missed notifications during peak sales cycles, and inefficient use of staff time.
- Approach C: Custom Standalone Web Portal
    - Concept: Develop an independent, proprietary web app from scratch for fashion orders and inventory tracking.
    - Trade-off: High tailorability, but introduces severe maintenance overhead, custom database security liabilities, and ongoing infrastructure costs.
- Approach D: Centralized Salesforce Solution (Selected)
    - Concept: Unify end-to-end menswear operations into a single Lightning-based CRM and operational hub.
    - Advantage: Enforces UI data integrity, secures business records out of the box, and natively automates repetitive workflows across sales, inventory, and finance.

Core Platform Capabilities & Automated Workflows

- Real-Time Order Confirmation Automation: Instantly triggers branded confirmation emails to customers upon order status transition, eliminating manual drafting and boosting customer engagement.
- Dynamic Tier-Based Loyalty Engine: Automatically calculates total lifetime/purchase value to promote shoppers to appropriate loyalty tiers, driving repeat business without staff intervention.
- Automated Low-Stock Threshold Alarms: Continuously evaluates warehouse inventory and fires immediate email alerts to logistics teams when apparel counts drop below 5 units, preventing out-of-stock scenarios.
- Automated Midnight Bulk Order Processing: Employs Scheduled/Asynchronous Apex to batch-process daily high-volume wholesale orders at midnight, reconciling inventory levels and balancing financial ledgers automatically.
- Unified Lightning User Workspace: Consolidates customer profiles, product catalogs, order records, and inventory metrics into a single role-based Salesforce interface to maintain data integrity and speed up daily tasks.

Step 2: Grouping

Group	Ideas	Description
Manual Approaches	Spreadsheet management and manual email confirmation	Basic approaches that demand a lot of involvement from users
Standalone / Partly Automated Solutions	Standalone retail application	Gives more automation, but a separate application has to be developed and maintained
Automated Solution Built on Salesforce	Salesforce management system, automated confirmation, loyalty automation, stock alerts, scheduled bulk processing, and a Lightning application	Gives centralized data management, automation, and business processing that scales

Step 3: Idea Prioritization

Each idea was judged on four simple factors:

- **Impact: Measures the value added to sales and operations.**
- **Feasibility: Checks how easily the idea can be put into practice.**
- **Cost: Weighs the build effort against ongoing maintenance needs.**
- **Efficiency: Focuses on eliminating repetitive manual tasks.**

Idea	Impact	Feasibility	Cost
Spreadsheet-based inventory & sales tracking	Low	High	High
Manual email confirmation by staff	Medium	Medium	High
Standalone custom fashion web portal	High	High	High
Centralized Salesforce management platform	High	High	High
Dynamic tier-based loyalty management	High	High	High
Loyalty management that is dynamic	High	High	High
Proactive low-stock email alerts (< 5 units)	High	High	High
Scheduled midnight bulk order processing	High	Medium	High

3. REQUIREMENT ANALYSIS PHASE

3.1 Customer Journey Map

The customer journey passes through several major stages: registering the customer, selecting products, processing the order, verifying inventory, sending notifications, and monitoring the business.

Phase 1: Customer Onboarding

- **User Action: Customer signs up and provides contact details.**
- **Touchpoints: Salesforce Account records and sales personnel.**
- **Pain Point: Risk of duplicate, incomplete, or incorrectly formatted records.**
- **HandsMen Threads Solution: UI-level input validation ensures clean, verified customer master data at the point of entry.**
- **User Emotion: Optimistic and engaged.**

Phase 2: Product & Collection Browsing

- **User Action: Shopper browses menswear catalog to verify styles, pricing, and availability.**
- **Touchpoints: Product database and warehouse stock logs.**
- **Pain Point: Lack of clear, real-time inventory counts across items.**
- **HandsMen Threads Solution: Unified product and stock visibility within Salesforce gives staff instant inventory clarity.**
- **User Emotion: Interested yet hesitant.**

Phase 3: Order Placement

- **User Action: Customer finalizes apparel selections and defines unit quantities.**
- **Touchpoints: Order record interface and sales representatives.**
- **Pain Point: Inaccurate quantity entries, pricing mismatches, or missing order details.**

- **HandsMen Threads Solution: Form-level validation rules ensure all critical specifications and minimum quantities are accurate before submission.**
- **User Emotion: Anxious about order accuracy.**

Phase 4: Warehouse Stock Verification

- **User Action: System verifies warehouse capacity against the requested order volume.**
- **Touchpoints: Product records and inventory allocation trackers.**
- **Pain Point: Inability to detect low inventory prior to order commitment.**
- **HandsMen Threads Solution: Centralized inventory tracking monitors availability and automatically catches stock levels below threshold.**
- **User Emotion: Cautious.**

Phase 5: Order Execution & Fulfillment

- **User Action: Order moves into warehouse staging and fulfillment once cleared.**
- **Touchpoints: Fulfillment queue and order detail pages.**
- **Pain Point: Manual operational handoffs cause delayed status progression.**
- **HandsMen Threads Solution: Salesforce workflow automation orchestrates status updates, task routing, and record syncing.**
- **User Emotion: Uncertain during processing.**

Phase 6: Order Confirmation & Notification

- **User Action: Customer awaits formal confirmation and transaction receipt.**
- **Touchpoints: Transactional email and customer communication records.**
- **Pain Point: Delayed, inconsistent, or forgotten manual email outreach.**
- **HandsMen Threads Solution: Instant automated email confirmations are dispatched as soon as the order status changes to confirmed.**
- **User Emotion: Relieved and assured.**

Phase 7: Fulfillment Oversight & Account Growth

- **User Action: Apparel is delivered; operations monitors metrics and customer earns loyalty standing.**
- **Touchpoints: Executive dashboards, customer records, and loyalty program ledgers.**
- **Pain Point: Disconnected data makes holistic operational monitoring and loyalty rewarding tedious.**
- **HandsMen Threads Solution: Native Salesforce dashboards centralize KPI reporting, while dynamic loyalty tiers update automatically based on spend.**
- **User Emotion: Confident and satisfied.**
- **Solution Functional Requirements**

FR-1: Customer Master Data Management

- **Purpose: Provide a centralized hub for managing client profiles and relationship data.**
- **Scope: Enables authorized staff to view, create, and maintain customer accounts while enforcing front-end UI data integrity to prevent erroneous data capture.**

FR-2: Product Catalog & Warehouse Inventory Control

- **Purpose: Oversee apparel line specifications alongside real-time stock levels.**
- **Scope: Maintains key product variables (SKU, fabric type, category, price, and available count) and feeds live inventory numbers to restock management workflows.**
- **FR-3: Guided Order Processing**
- **Purpose: Structure the end-to-end order generation workflow for retail and bulk clients.**
- **Scope: Allows sales staff to generate and manage orders against live inventory records, using validation logic to eliminate incorrect or incomplete submissions.**

FR-4: Automated Post-Order Communication

- **Purpose: Keep buyers instantly informed without requiring manual staff outreach.**

- **Scope: Triggers an immediate branded email notification containing line-item summaries and confirmation numbers as soon as an order is marked confirmed.**

FR-5: Dynamic Customer Loyalty Management

- **Purpose: Incentivize repeat purchases through tiered client recognition.**
- **Scope: Automatically evaluates customer purchase history and updates loyalty status tiers based on predefined spending thresholds, driving personalized engagement.**

FR-6: Proactive Inventory Threshold Alerts

- **Purpose: Prevent stockouts across high-demand garment lines.**
- **Scope: Automatically sends instant email alerts to warehouse fulfillment teams whenever stock counts dip below five units, prompting timely reorders.**

FR-7: Scheduled Bulk Order Processing

- **Purpose: Automate wholesale fulfillment and financial reconciliation.**
- **Scope: Executes an Asynchronous Apex batch job daily at midnight to process large-volume orders, updating financial ledgers and adjusting warehouse inventory in bulk.**

FR-8: Operational Reports & Executive Dashboards

- **Purpose: Enable data-driven decisions through real-time operational visibility.**
- **Scope: Delivers centralized reports and interactive dashboards monitoring order volume, inventory thresholds, customer retention, loyalty tiers, and sales revenue.**

Non-Functional Requirements

NFR-1: Data Security & Access Governance

- **Description: Safeguard sensitive customer, financial, and inventory data against unauthorized access.**
- **Implementation: Configures Salesforce profiles, role hierarchies, permission sets, sharing rules, and field-level security (FLS) to mirror business responsibilities.**

- **Acceptance Criteria:**
- **Users can access only designated records, fields, and objects aligned with their role.**
- **Unauthorized users cannot view or modify restricted client and financial information.**
- **Privilege escalation and access restrictions are enforced systematically.**

NFR-2: User Experience & Usability

- **Description: Deliver a streamlined, intuitive interface tailored to everyday sales and warehouse workflows.**
- **Implementation: Employs Lightning App pages, role-optimized page layouts, tab navigation, and clear record highlights.**
- **Acceptance Criteria:**
- **Primary navigation tabs and custom objects are reachable within two clicks.**
- **Critical data fields and action buttons are visibly prioritized on record pages.**
- **Sales and inventory personnel can complete routine order tasks with minimal operational guidance.**

NFR-3: System Performance & Execution Efficiency

- **Description: Ensure high-speed responsiveness across transactional and background processes.**
- **Implementation: Optimizes declarative flows, validation rules, queries, and asynchronous batch jobs to prevent system lag.**
- **Acceptance Criteria:**
- **Standard UI page loads and record saves complete within acceptable operational thresholds.**
- **Automated workflows and email triggers execute immediately once trigger criteria are met.**
- **Analytical reports and executive dashboards refresh without timing out.**

NFR-4: Architectural Scalability

- **Description: Support expanding business operations and increasing order volumes over time.**
- **Implementation: Uses modular Salesforce standard and custom objects alongside scalable asynchronous Apex designs.**
- **Acceptance Criteria:**
- **Influxes in customer profiles, apparel lines, and order records do not require foundational schema redesigns.**
- **Existing security and role frameworks easily accommodate new organizational hires.**
- **Midnight batch processing and transactional flows maintain stability as record volumes scale.**

NFR-5: Reliability & High Availability

- **Description: Guarantee dependable system access and consistent background execution during operational hours.**
- **Implementation: Relies on Salesforce multi-tenant cloud architecture, robust error-handling, and resilient batch scheduling.**
- **Acceptance Criteria:**
- **Successfully committed updates persist reliably across related master-detail and lookup records.**
- **Scheduled midnight batch jobs and real-time triggers execute reliably without unhandled exceptions.**
- **Real-time business metrics remain consistently accessible to decision-makers.**

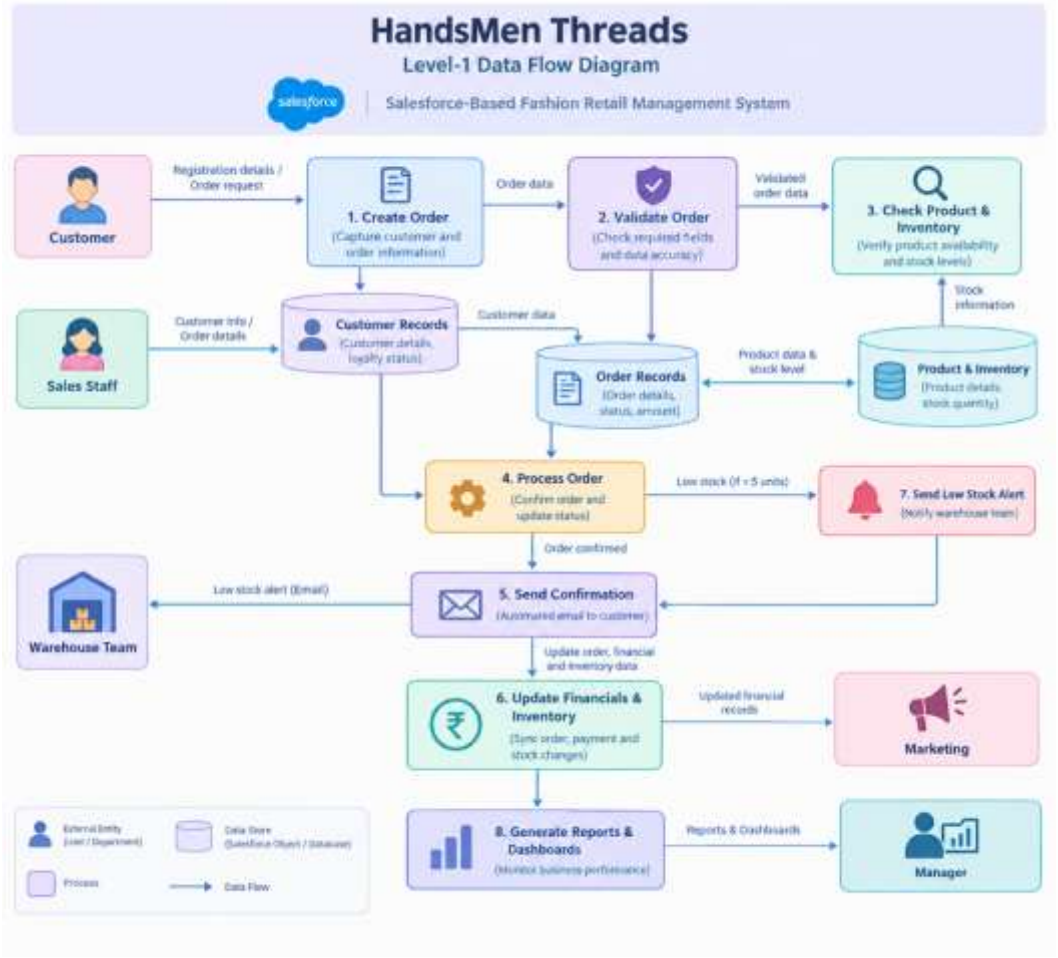

NFR-6: Data Accuracy & Consistency

- **Description: Maintain uncompromised data integrity across customer, order, inventory, and financial records.**

- **Implementation: Combines mandatory field definitions, front-end validation rules, automated cross-object rollups, and controlled data capture.**
- **Acceptance Criteria:**
- **Orders cannot be saved with incomplete required fields or invalid product specifications.**
- **Cross-object updates automatically synchronize inventory deductions and financial values.**
- **Data validation prevents the generation of orphan records and reduces duplicate customer entries.**

3.3 Data Flow Diagram

The diagram below is the Level-1 data flow diagram, which covers the system's main steps.

Each step in the diagram is described here:

Stage 1: Order Capture & Data Entry

- **Sales representatives or retail shoppers input customer credentials, product selections, and line-item details into the Salesforce interface.**

Stage 2: UI Validation & Record Creation

- **The system checks all required fields for accuracy and integrity before committing new records, creating clean customer accounts and order lines while referencing live product catalogs.**

Stage 3: Stock Verification & Low-Stock Detection

- **Available quantities across warehouse inventories are verified against requested volumes, automatically flagging products where stock levels drop below five units.**

Stage 4: Automated Order Fulfillment

- **The order advances through structured fulfillment stages, updating statuses and syncing associated line items across operational queues.**

Stage 5: Communications, Financials & Restock Alerts

- **Upon reaching confirmed status, the system dispatches an automated branded confirmation email to the buyer, triggers restock alerts to the warehouse team if inventory thresholds are breached, and recalculates financial and stock ledgers.**

Stage 6: Performance Analytics & Dashboards

- **Stored order metrics, adjusted stock levels, customer spend, and updated loyalty tiers feed directly into real-time Salesforce reports and executive dashboards for continuous business monitoring.**

4. PROJECT DESIGN PHASE

4.1 Problem–Solution Fit

Here, the project design phase sets out how Salesforce will be used to resolve the business problems identified. Each major problem is mapped to a suitable Salesforce solution, and the proposed system architecture is described.

Problem Statement
Typical challenges in managing customers, products, orders, inventory, loyalty activities, and business operations are addressed by the HandsMen Threads Salesforce solution. It relies on

Salesforce features to centralize information, keep data accurate, and automate repetitive processes.

Problem sloving mapping

Problem / User Constraint	HandsMen Threads Solution	Salesforce Capability
Customer information might be entered in an incomplete or incorrect way.	Keep customer information centralized and in a validated format.	Validation Rules, Custom Objects, Fields
Managing product information and availability manually might be difficult.	Keep information about products and stock centralized.	Lightning App, Custom Objects, Fields
Order details entered by sales staff could be incorrect or incomplete.	Validate information about the order before it is processed.	Validation Rules, Required Fields, Flows
Customers may fail to receive order updates on time.	After an order is confirmed, send confirmation emails automatically.	Email Alerts, Record-Triggered Flow
It may take a while to notice low stock.	Keep track of stock levels, and tell the warehouse team when stock drops under the defined threshold.	Email Alerts, Flow Automation, Formula Fields
Loyalty updates for customers may need manual effort.	Update loyalty information automatically from what customers have purchased.	Flow Automation, Custom Fields
Customer information for engagement might not be organized well enough for marketing staff.	Rely on centralized customer and purchase information to back marketing activities.	Customer Records, Reports, List Views
Manual processing over and over may be needed for bulk orders.	Process bulk orders using scheduled automation, and update the related records.	Batch Apex, Scheduled Apex
Managers might see only a limited part of business activities.	Offer reports and dashboards, centralized, for monitoring.	Dashboards, Reports, Lightning App

4.2 Proposed Solution

Parameter	Description
Problem	Handling customers, products, orders, inventory, loyalty, and business activities by hand can produce inaccurate data, delayed communication, stock problems, and repeated work.
Solution	A management system for HandsMen Threads built on Salesforce that brings business information together and automates key retail processes.
Novelty	Salesforce capabilities let the solution combine data validation, automated order confirmation, loyalty updates, low-stock alerts, and scheduled bulk processing.
Social Impact	Customer service gets better, manual work shrinks, notifications arrive on time, and staff are able to run business activities more efficiently.
Revenue Model	Sales of fashion products are supported by the system through better customer engagement, loyalty, order processing, and inventory management.
Scalability	More customers, products, orders, and users can be supported by the system. As the organization grows, further automation and business features can be added.

4.3 Solution Architecture

1. Users Layer

Different team members use the system based on their job duties:

- **Sales Team:** Adds new customers and creates orders.
- **Warehouse Staff:** Checks stock levels and handles restocking.
- **Marketing Team:** Reviews customer purchase history and loyalty perks.
- **Managers:** Checks sales results, inventory health, and team performance.
- **Admins:** Sets up user accounts and keeps data secure.

2. Presentation Layer

The screens and tools team members use every day in Salesforce:

- **Custom App:** A single workspace with all the tabs they need.
- **Record Pages:** Simple layouts showing important details on one screen.
- **List Views:** Quick lists to filter and find orders or products fast.
- **Reports & Dashboards:** Visual charts showing daily business numbers.

3. Automation Layer

Automated tools that handle repetitive work without manual effort:

- **Validation Rules:** Stops errors by checking that all required fields are filled out correctly.
- **Flows:** Automatically triggers actions, like updating an order status when payment arrives.
- **Email Alerts:** Sends instant confirmation emails to buyers and low-stock alerts (< 5 units) to the warehouse.
- **Scheduled Batch Jobs:** Runs every midnight to process high-volume bulk orders and adjust stock numbers.

4. Data Layer

The central database storing all company records in one connected place:

- **Customer Info:** Contact details, buying history, and loyalty status.
- **Product Catalog:** Apparel styles, sizes, and pricing.
- **Orders:** Items bought, quantities, totals, and delivery progress.
- **Inventory:** Current warehouse counts and restock thresholds.

5. Security Layer

Rules that ensure people only see what they need for their job:

- **Profiles & Roles:** Controls which tabs and records each department can open.
- **Field-Level Security:** Hides sensitive numbers (like financial data) from unauthorized staff.
- **Sharing Rules:** Keeps private customer details safe while letting teams share needed order files.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The Agile methodology is followed in the HandsMen Threads Salesforce project: work is divided into smaller modules, called epics and user stories. Through several sprints, development and configuration activities get completed, and at each stage the team can review progress and make improvements.

Product Backlog and Sprint Schedule

Sprint	Functional Requirement / Epic	User Story No.	User Story / Task	Story Points	Priority
Sprint 1	Developer Environment Setup	USN-1	As an administrator, I want the Salesforce environment configured so that the HandsMen Threads system can be built and tested.	1	High
Sprint 1	Data Modeling	USN-2	As an administrator, I want the necessary custom objects created so that information on customers, products, orders, inventory, and loyalty can be stored.	5	High
Sprint 2	Data Modeling	USN-3	As a user, I want dedicated tabs for the main business records so that the information I require is easy to reach.	3	High
Sprint 2	Data Modeling	USN-4	As an administrator, I want the necessary fields created so that business information can be captured in a complete and accurate way.	5	High
Sprint 2	Data Modeling	USN-5	As an administrator, I want relationships set up between related records so that business information can be linked and managed efficiently.	5	High
Sprint 2	Application Setup	USN-6	As a user, I want a centralized HandsMen Threads Lightning App so that the business records I require are reachable from one interface.	3	High
Sprint 3	Automation of Processes	USN-7	As a system, I want validation rules so that customer, product, and order information that is incorrect or incomplete can be prevented.	3	High
Sprint 3	Automation of Processes	USN-8	As a system, I want automated flows to handle order confirmation, loyalty updates, and low-stock notifications so that manual work is lowered.	5	High
Sprint 3	Automation of Processes	USN-9	As a system, I want low-stock products to be identified, with the warehouse team notified when stock falls under the required level.	3	High
Sprint 4	Apex Coding	USN-10	As a system, I want Apex components that deal with complex business operations so that the processing required can be automated efficiently.	5	High
Sprint 5	Async Processing	USN-11	As a system, I want bulk orders to be processed through scheduled and batch processing so that records in large numbers can be handled efficiently.	5	High

Sprint	Functional Requirement / Epic	User Story No.	User Story / Task	Story Points	Priority
Sprint 5	Access & Security	USN-12	As an administrator, I want suitable user access configured so that business information is available in line with what users are responsible for.	5	High
Sprint 6	Reporting & Dashboards	USN-13	As a manager, I want reports and dashboards on orders, inventory, customers, and business activities so that I can follow performance and make well-informed decisions.	4	High

Epic Summary

Epic	User Stories	Story Points
Developer Environment Setup	USN-1	1
Data Modeling	USN-2 to USN-5	18
Application Setup	USN-6	3
Automation of Processes	USN-7 to USN-9	11
Apex Coding	USN-10	5
Async Processing	USN-11	5
Access & Security	USN-12	5
Reporting & Dashboards	USN-13	4
Total	13 User Stories	52

Sprint Schedule Summary

Sprint	Main Activities
Sprint 1	Setting up Salesforce and creating the core data objects
Sprint 2	Lightning App, tabs, relationships, and fields
Sprint 3	Inventory alerts, notifications, flows, and validation rules
Sprint 4	Complex business logic and Apex development
Sprint 5	Security configuration and batch/scheduled processing
Sprint 6	Final review, testing, reports, and dashboards

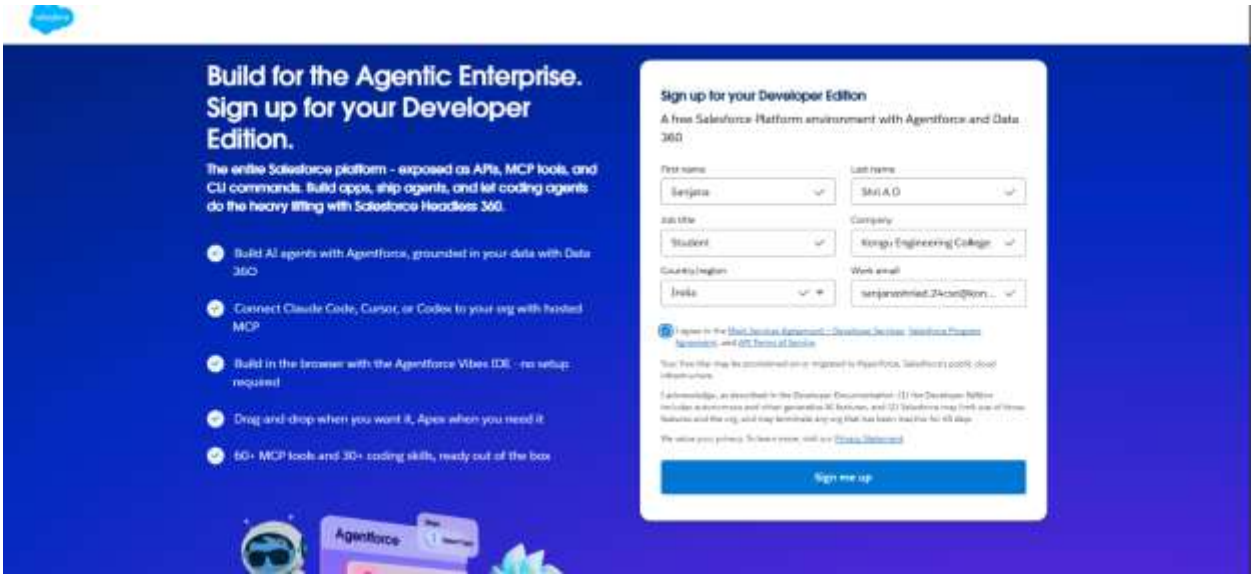

6. PROJECT DEVELOPMENT PHASE

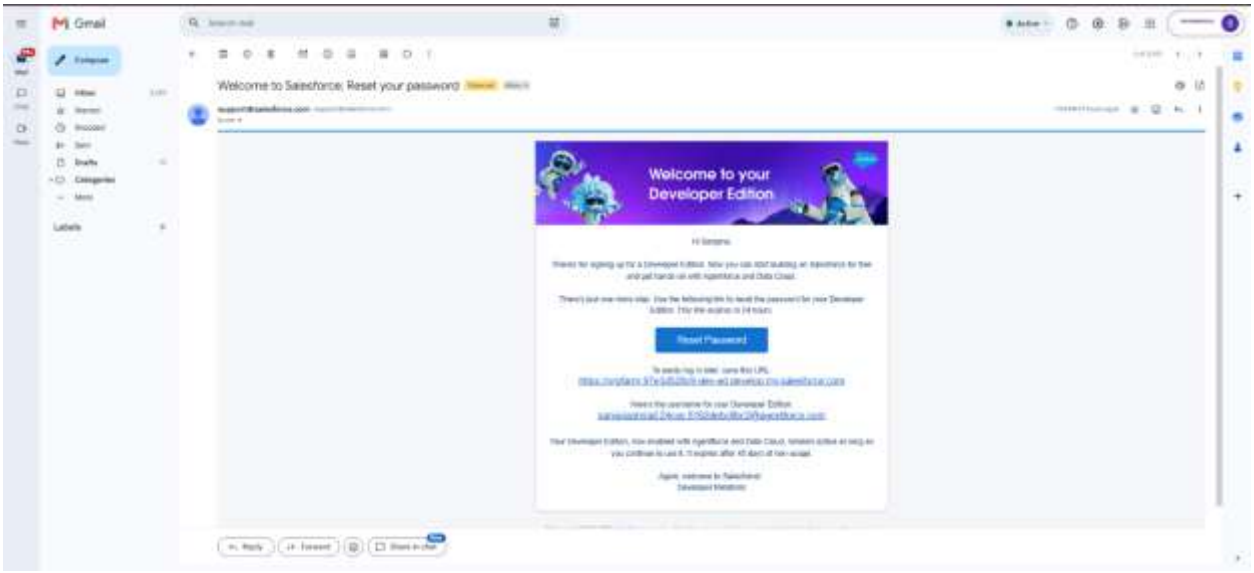

Milestone 1: Salesforce Developer Account Creation

Definition: The building, testing, and demonstration of the HandsMen Threads application all take place in the environment a Salesforce Developer Edition offers.

Key steps:

- Create a Salesforce Developer account.
- Confirm the email address that was used to register.
- Log in to Salesforce.
- Open **Setup** and configure the development environment.

Milestone 2: Custom Object Creation

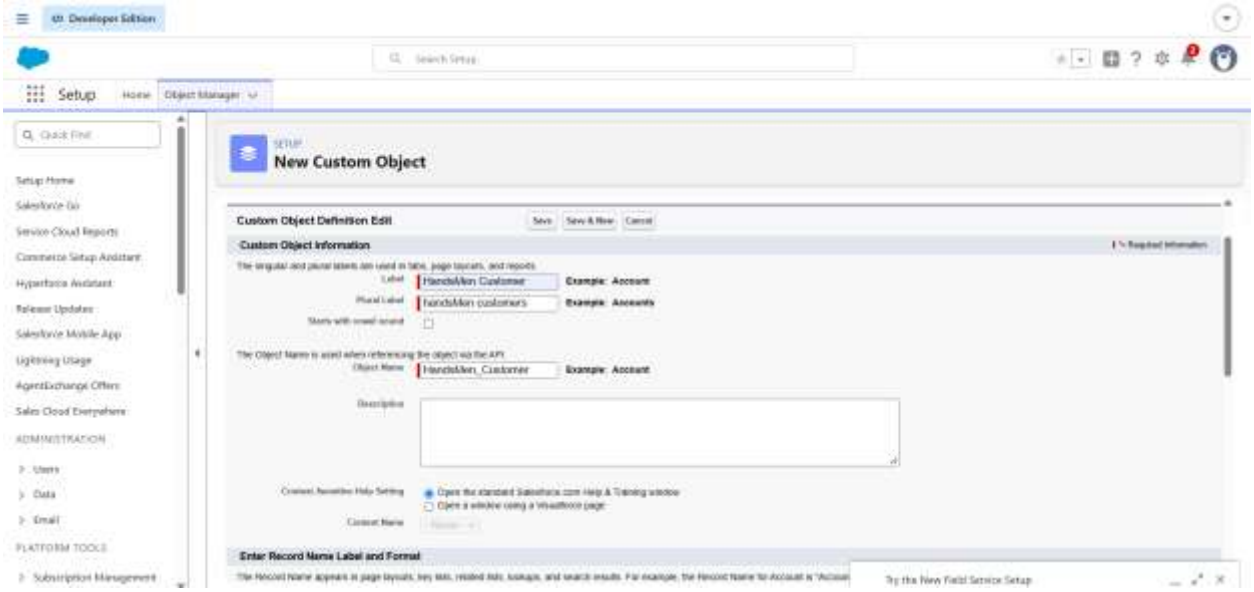

Definition: HandsMen Threads keeps and organizes its main business information in Custom Objects.

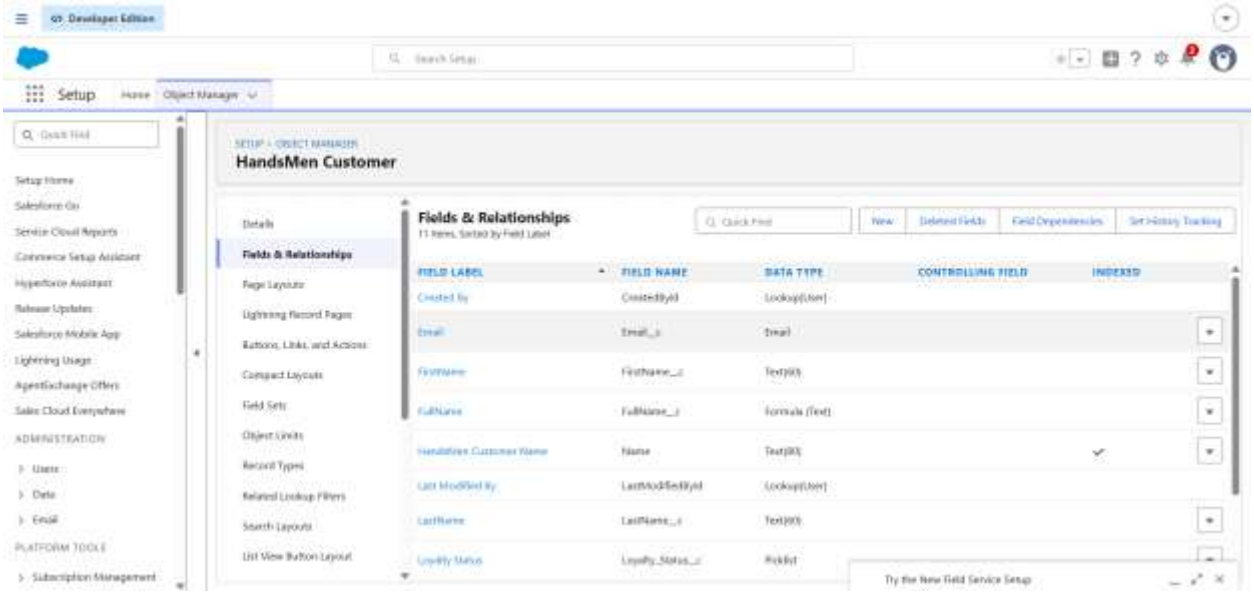

Objects:

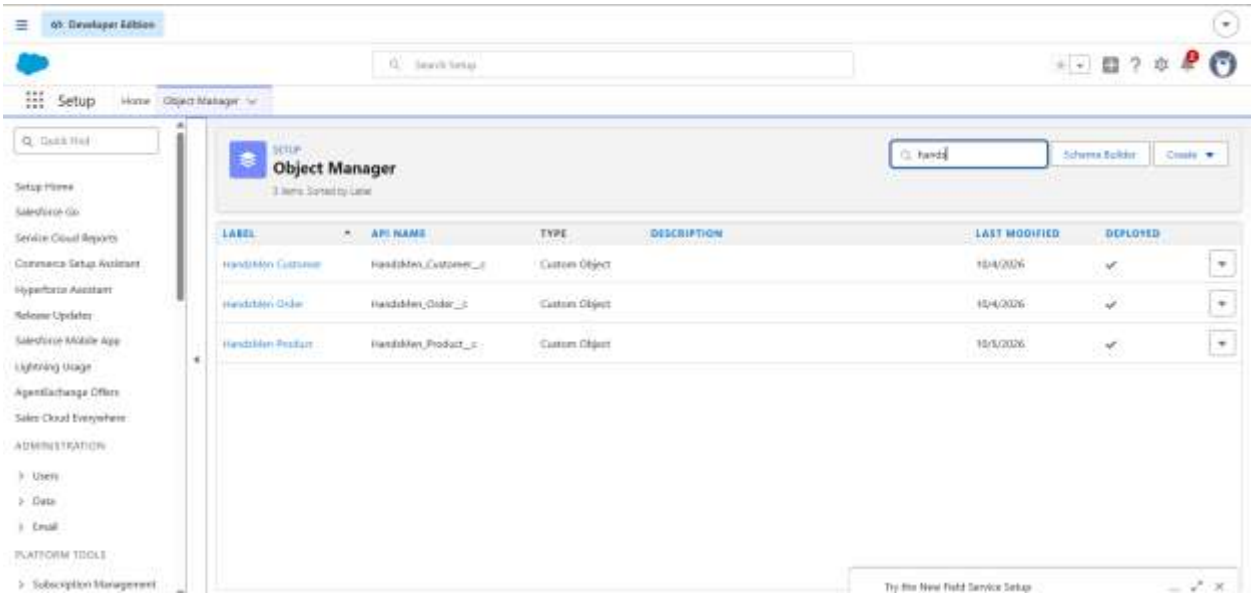

- **HandsMen Customer –** Holds details and contact information of customers.
- **HandsMen Product** – Holds details of products, such as name, category, price, and availability.
- **HandsMen Order –** Holds information about customer orders and order status.
- **Inventory –** Holds information about product stock and quantity.
- **Marketing Campaign** – Holds information about marketing and customer engagement.

Key steps:

- Go to **Setup → Object Manager**.
- Create the custom objects needed.
- Set up object labels and record names.
- Enable features that are required, such as reporting and search.
- Create tabs for the objects required.

Milestone 3: Tabs Creation

Definition

Through custom tabs, users get direct access to the HandsMen Threads records they need.

Create Tabs

- Go to **Setup → Tabs → Custom Object Tabs → New**.
- Choose the custom object needed.
- Choose a tab style that is appropriate.
- Configure tab visibility.
- Save the tab.
- Add the tabs needed to the HandsMen Threads Lightning App.

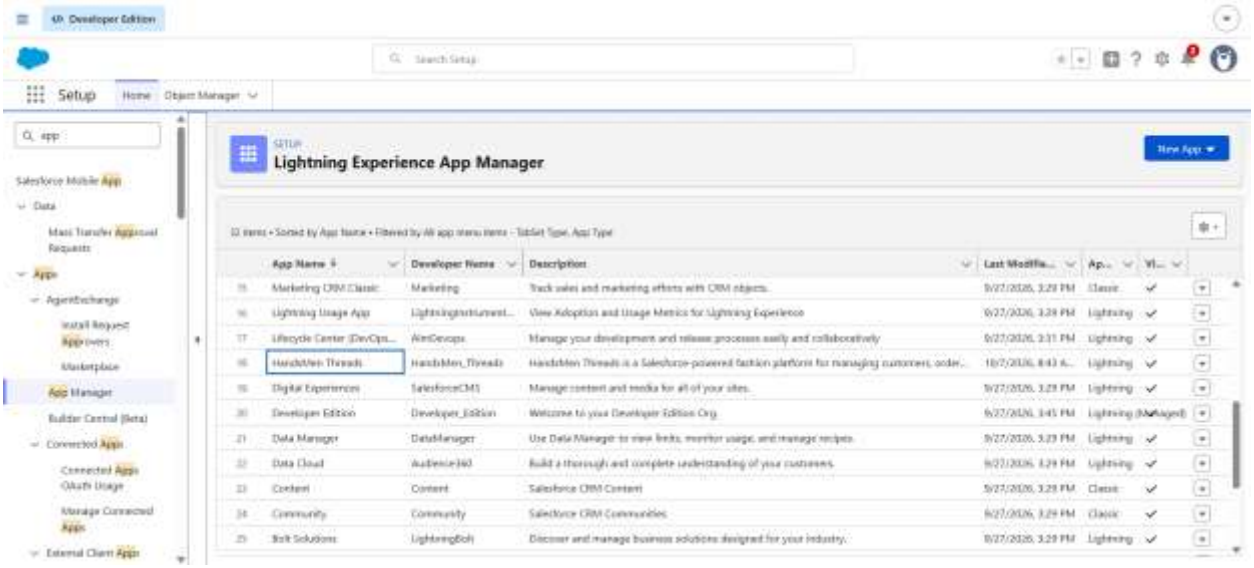

Milestone 4: Lightning App Creation

Definition: Business activities of the organization are managed from a centralized workspace, which the HandsMen Threads Lightning App provides.

Key Steps:

- Go to **Setup → App Manager → New Lightning App**.
- Enter the app name as **HandsMen Threads**.
- Set up navigation and branding for the app.
- Add tabs needed, such as Customer, Product, Order, Inventory, and Marketing Campaign.
- Add Reports and Dashboards in places where they are needed.
- Configure app visibility.
- Save the application and run a test.

Milestone 5: Fields Creation

Definition: Fields capture the information needed to manage customers, products, orders, inventory, and marketing activities.

Key fields:

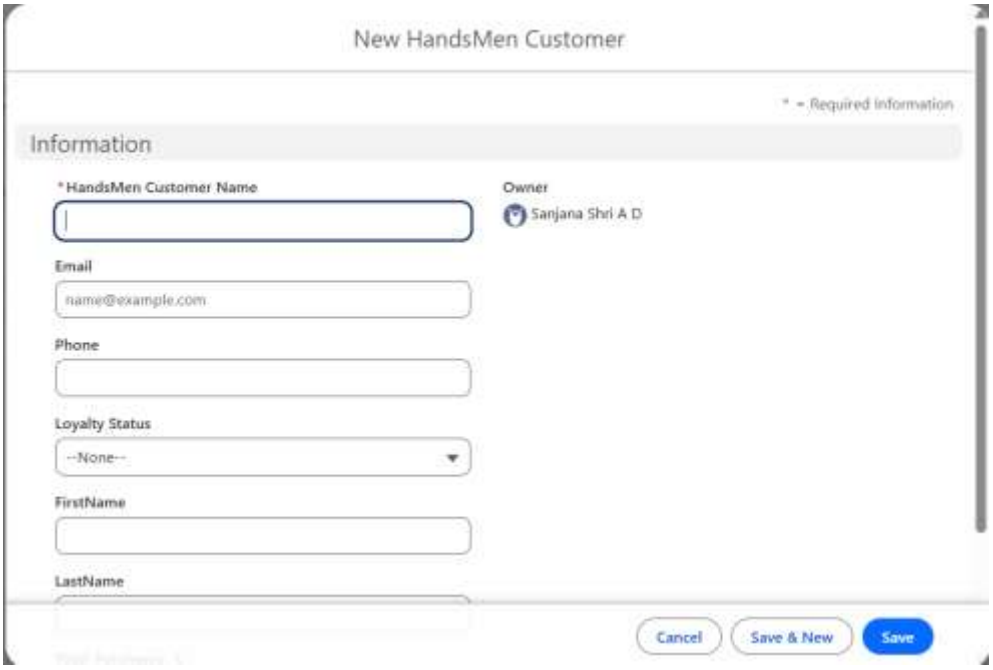

- **Email –** Holds the email address of the customer.
- **Phone –** Holds contact details of the customer.
- **Loyalty Status –** Holds the present loyalty status of the customer.
- **Order Status –** Tracks the stage of the order at present.
- **Order Quantity –** Stores the quantity ordered.
- **Product Price –** Holds information about product pricing.
- **Stock Quantity –** Stores available inventory.

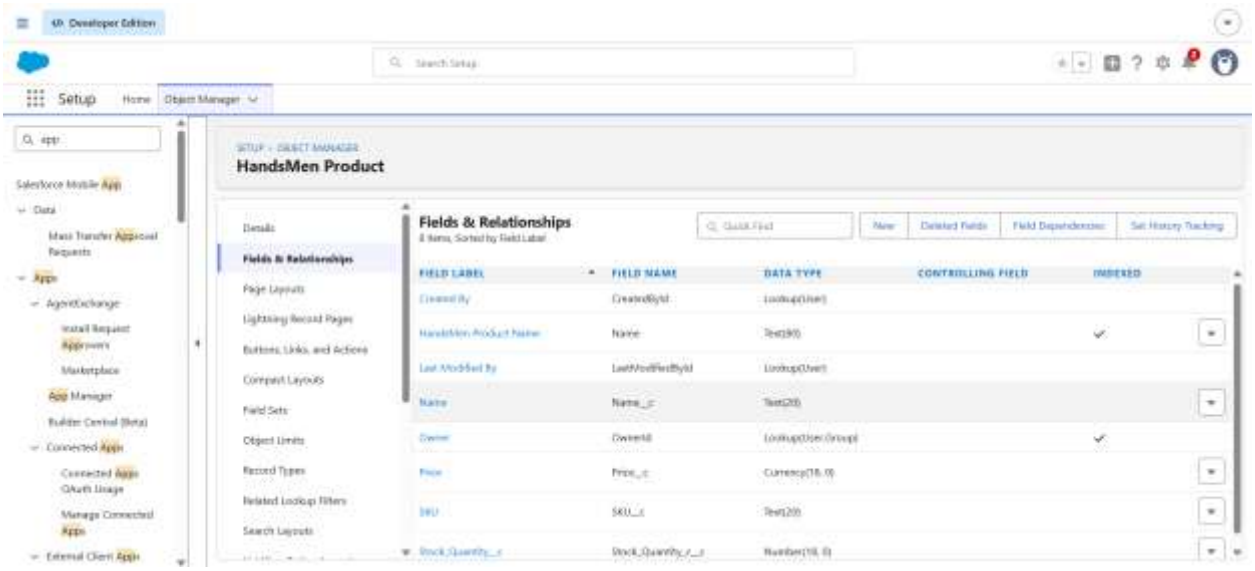

Relationships

Customer → Order
Product → Order
Product → Inventory

Key Steps:

- Go to **Object Manager → Object → Fields & Relationships → New**.
- Choose an appropriate type of field.
- Enter the field label and name.
- Set the values required and field-level security.
- Wherever needed, create relationship and formula fields.
- Add the fields to page layouts that are appropriate.

Milestone 6: Data Management – Field Creation & Field Types

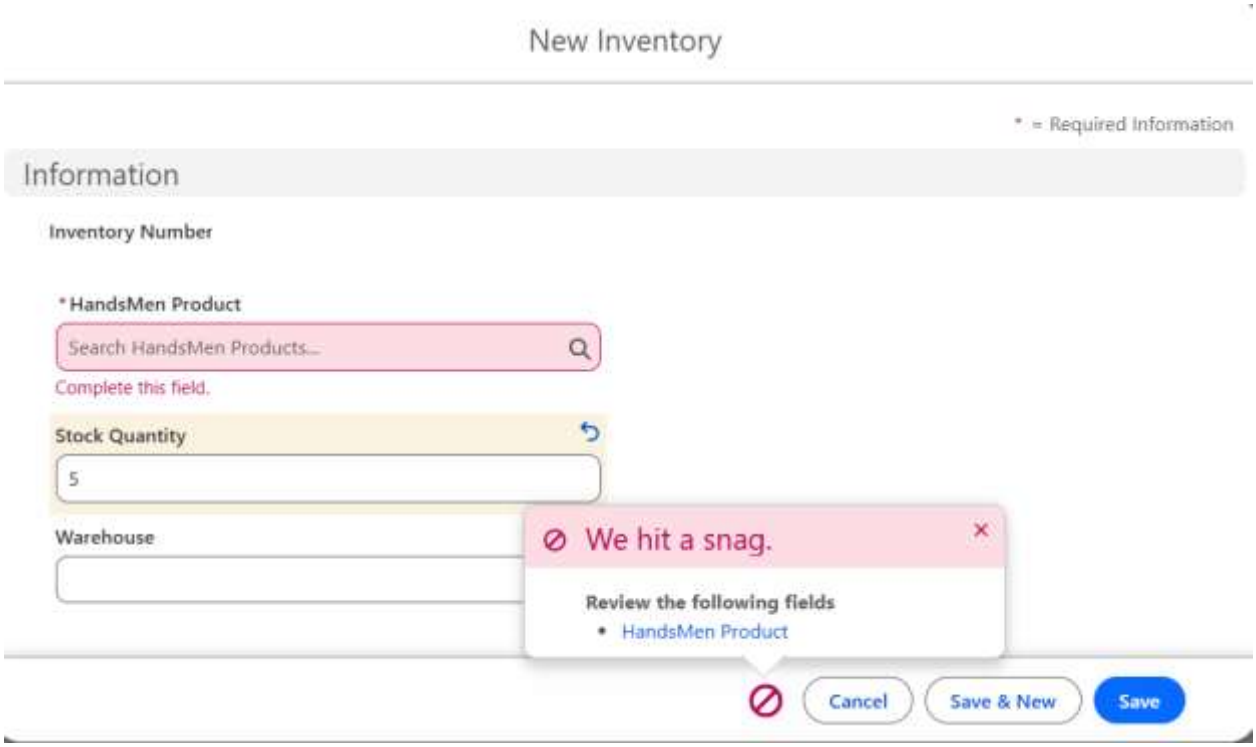

Definition: Validation Rules check that what is entered in Salesforce meets the required business conditions, right from the user interface. Records that are invalid or incomplete cannot be saved by users.

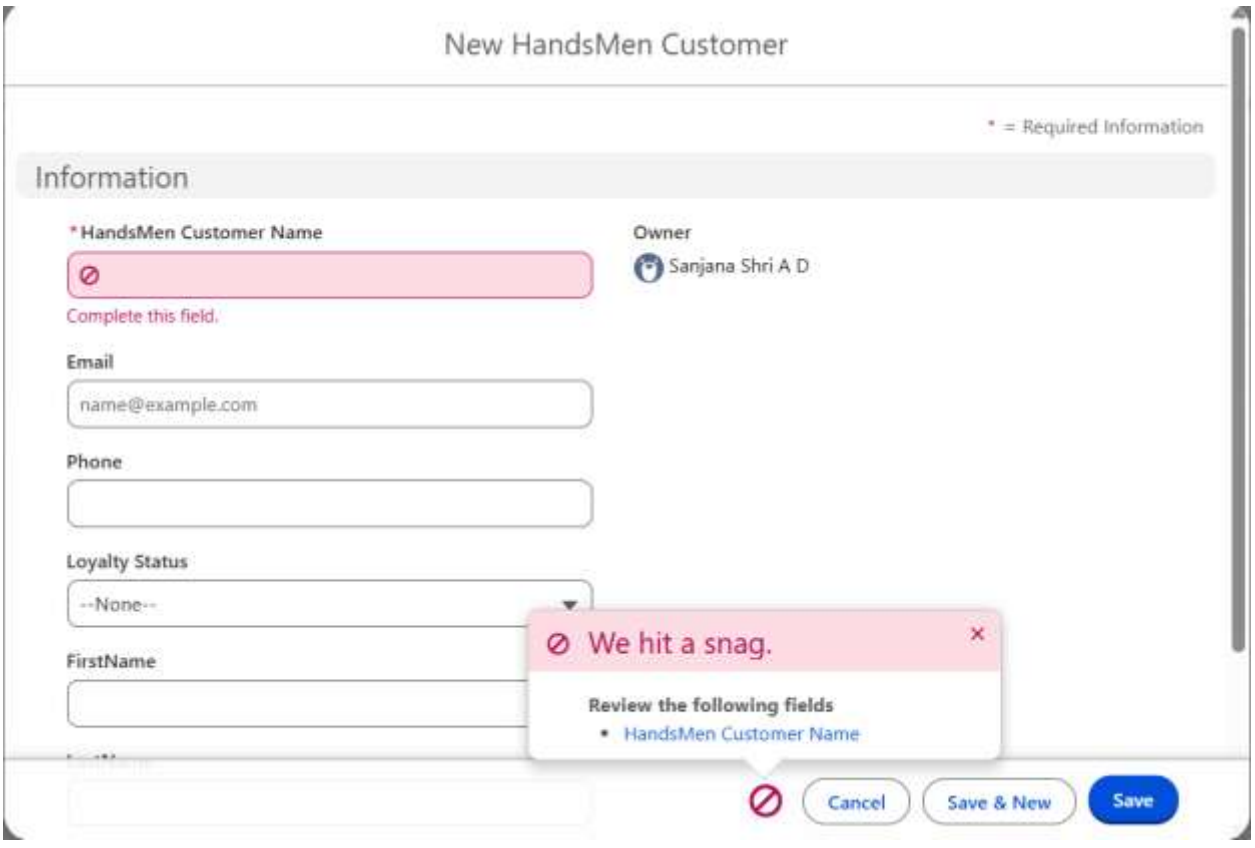

Key steps:

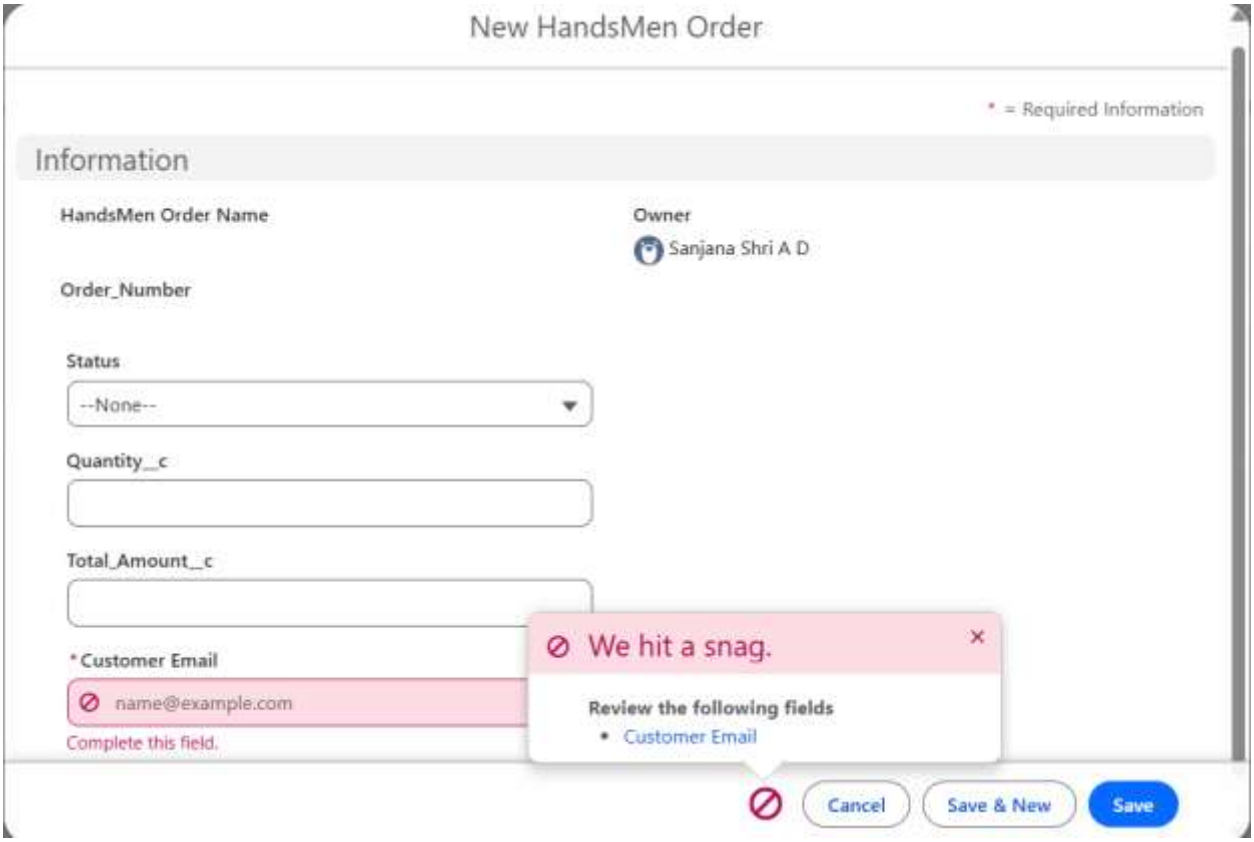

- Go to **Setup → Object Manager → Select Object → Validation Rules → New**.
- Enter the rule name.
- Define the validation condition with a Salesforce formula.
- Create rules for important information on customers, products, orders, and inventory.
- Set error messages that are suitable.
- Try the rules out using sample records that are valid and invalid.

Some examples of validation:

- The quantity ordered must be valid.
- The price of the product must not hold an invalid value.
- Information required about the customer must be given.
- The quantity in stock must be valid.

Milestone 7: Data Security – Roles

Definition: Roles and security settings decide who can access HandsMen Threads records, depending on what users are responsible for.

Key steps:

- Go to **Setup → Roles → Set Up Roles**.
- Create appropriate roles, for instance:

  Sales Staff

  Warehouse Team

  Marketing Team

  Manager

  Administrator

- Set up the roles according to what each is responsible for.
- Where required, configure Organization-Wide Defaults and sharing settings.
- Assign users to the roles that are appropriate.
- Test access permissions.

Milestone 8: Email Templates

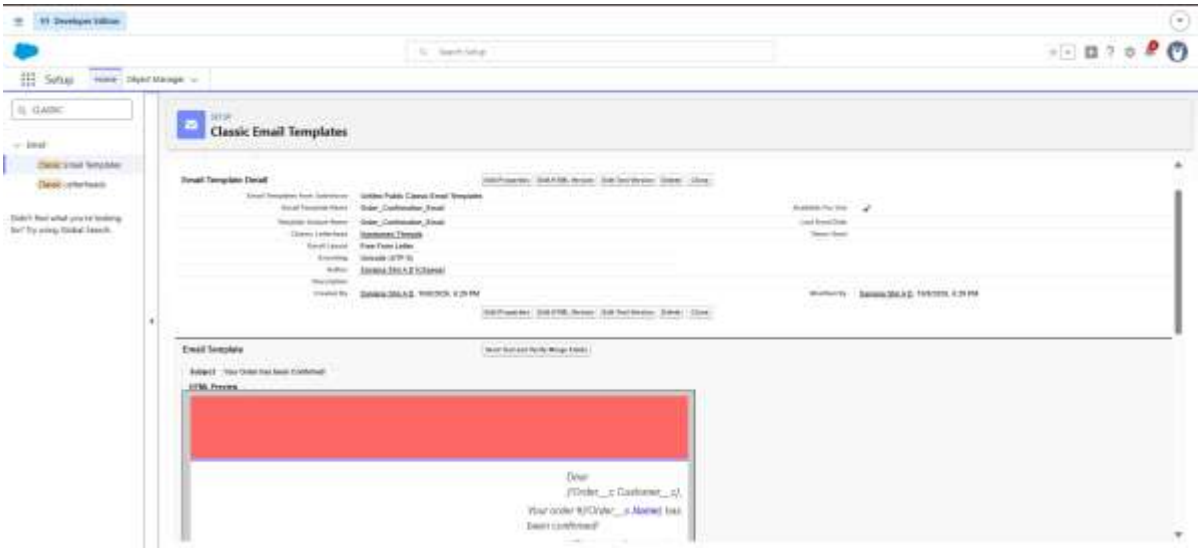

Definition: Email Templates give standardized messages for business notifications that are automated.

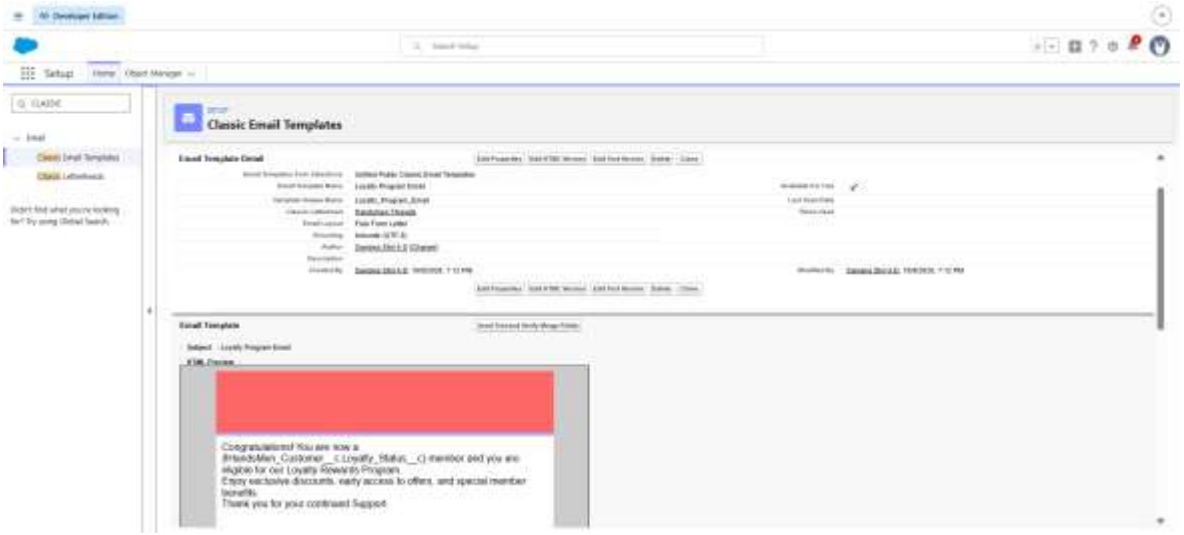

Key Templates

- Order Confirmation
- Low Stock Notification
- Loyalty Update

Key steps:

- Go to **Setup → Email Templates**.
- Create the email templates needed.
- Add merge fields that are appropriate, like customer name, order number, product, quantity, and order status.
- Set the subject and message of the email.
- Save the templates and try them out on sample records.

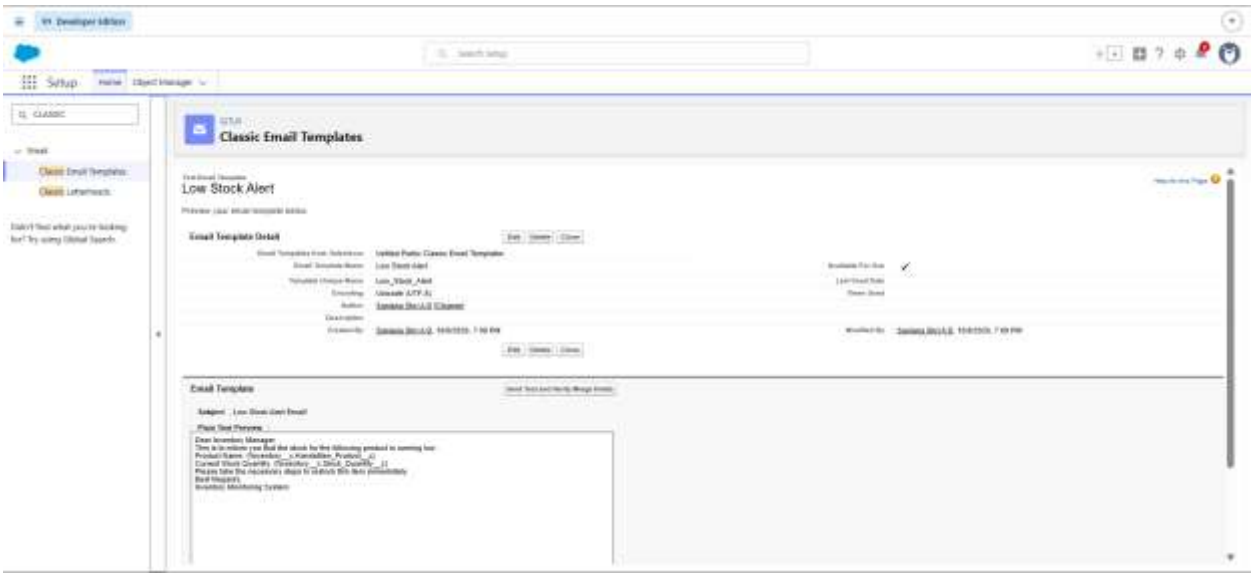

Milestone 9: Email Alert

Definition: Email Alerts send notifications automatically when a business condition that has been defined is satisfied.

Key steps:

- Go to **Setup → Email Alerts → New Email Alert**.
- Select the required object.
- Choose an email template that is appropriate.
- Add the required recipients.
- Set the alert up so that it works with the automation required.
- Save the email alert and try it out.

Milestone 10: FLOWS

Definition: Salesforce Flows take over repetitive business processes and lessen manual work.

Main Flows

1. Order Confirmation Flow
An email goes automatically to the customer once an order is confirmed.

2. Loyalty Update Flow
Loyalty information on the customer is updated according to the purchase conditions required.

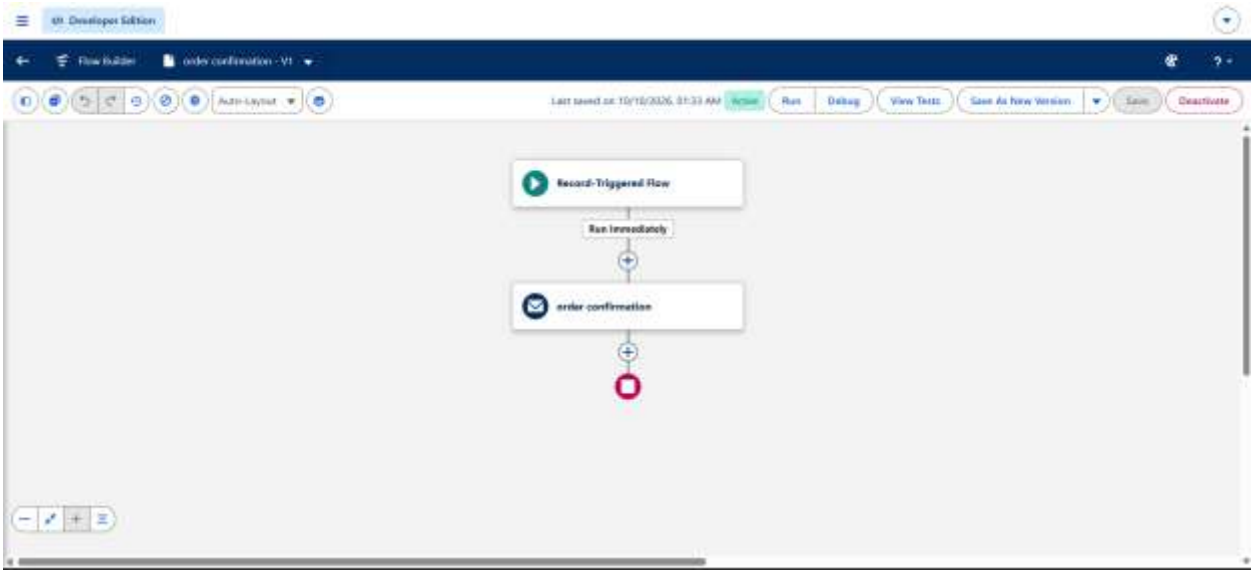

3. Stock Alert Flow
Products with stock under the defined threshold are found, and the Warehouse Team gets an alert.

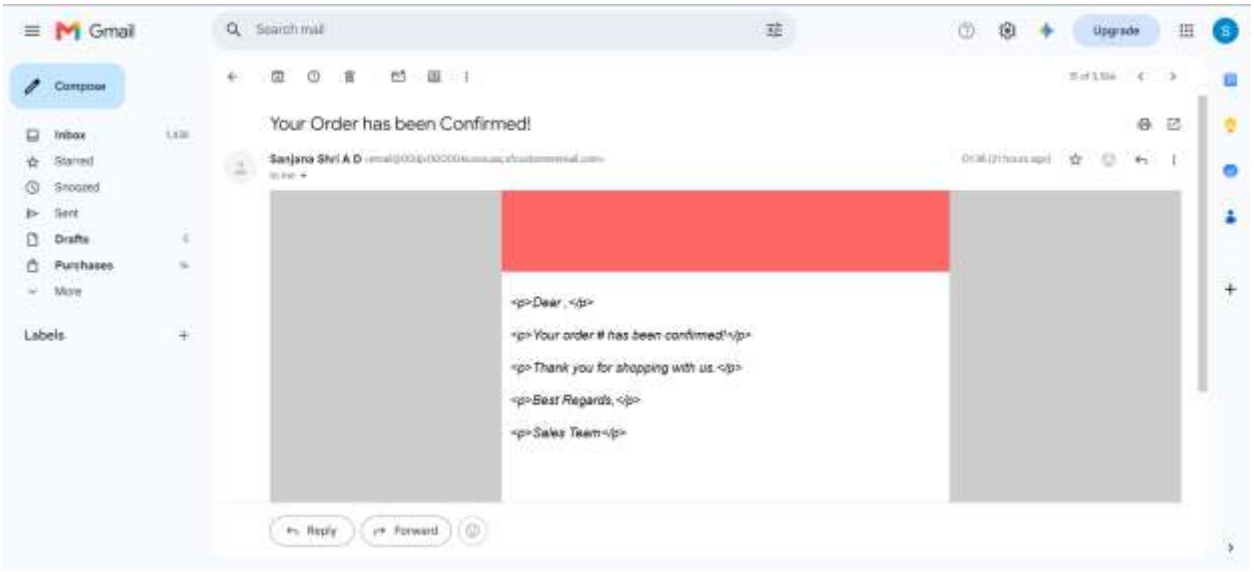

4. Scheduled Processing Flow
Supports business activities that are scheduled, where required.

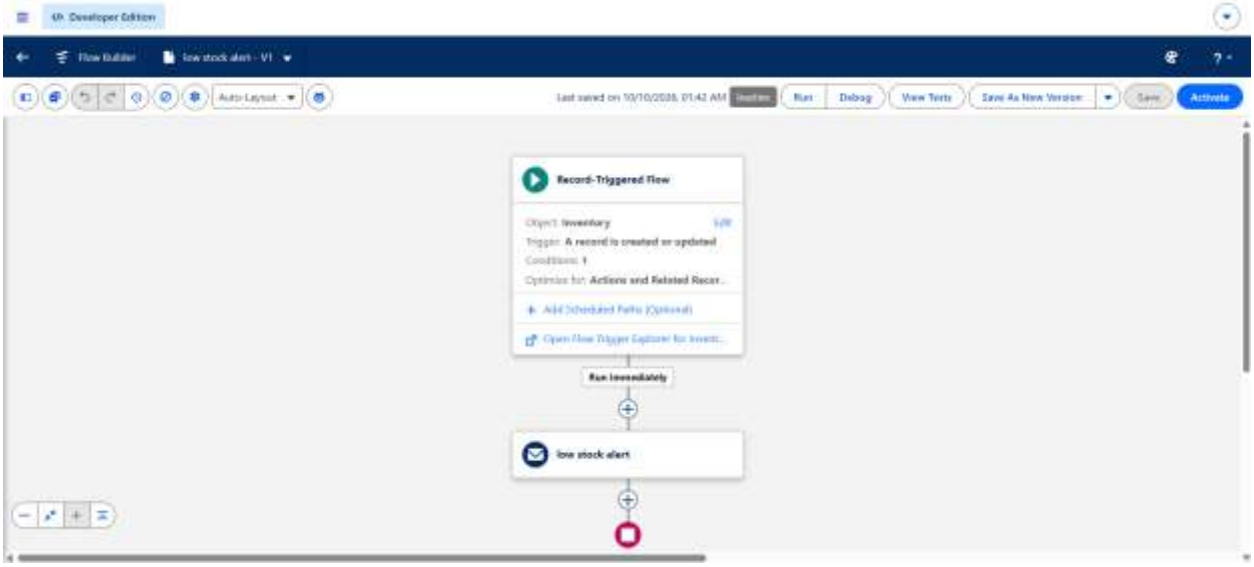

Key steps:

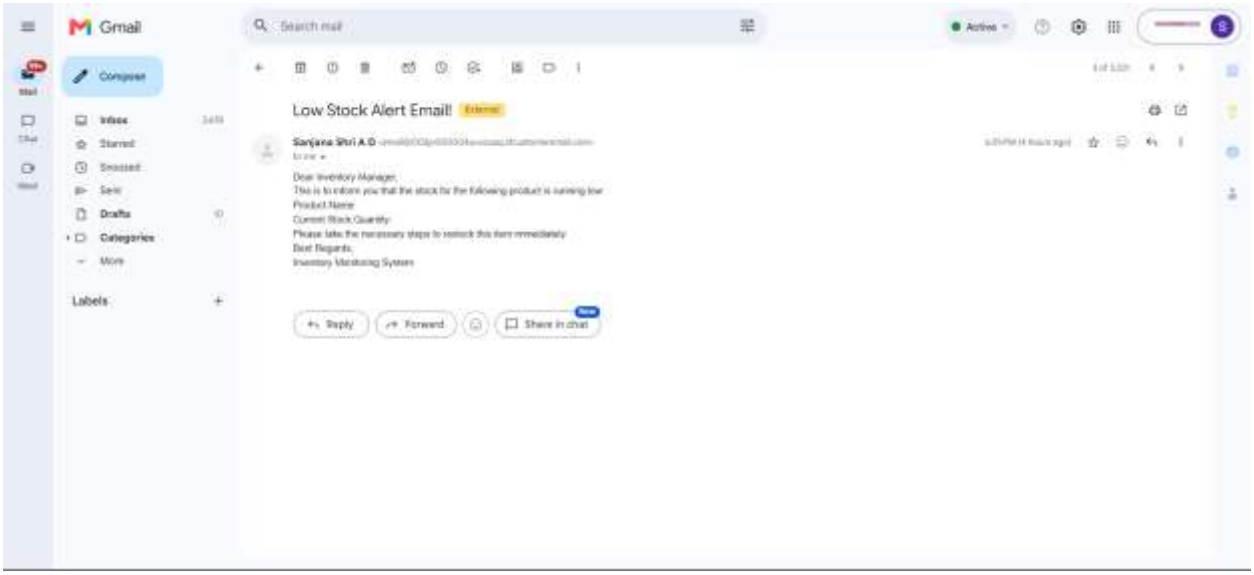

- Go to **Setup → Flows → New Flow**.
- Choose an appropriate type of flow.
- Choose the object needed and the trigger conditions.
- Set up the actions needed.

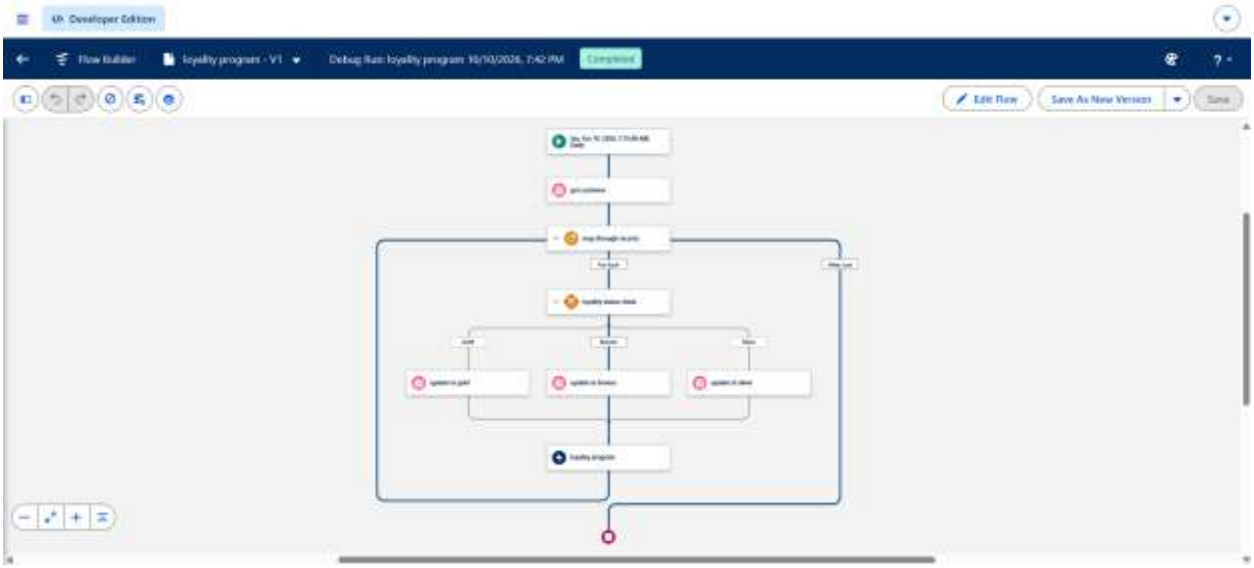

- Include record updates or email notifications.
- Save and activate the flow.
- Try the flow out on sample records.

Low Stock Alert Email!
Sanjana Shri A.D
Dear Inventory Manager,
This is to inform you that the stock for the following product is running low:
Product Name:
Current Stock Quantity:
Please take the necessary steps to restock this item immediately.
Best Regards,
Inventory Monitoring System

Milestone 11: Apex Class

Definition: Apex Classes carry out business logic that might call for programmatic processing beyond what standard Salesforce configuration and Flow can do.

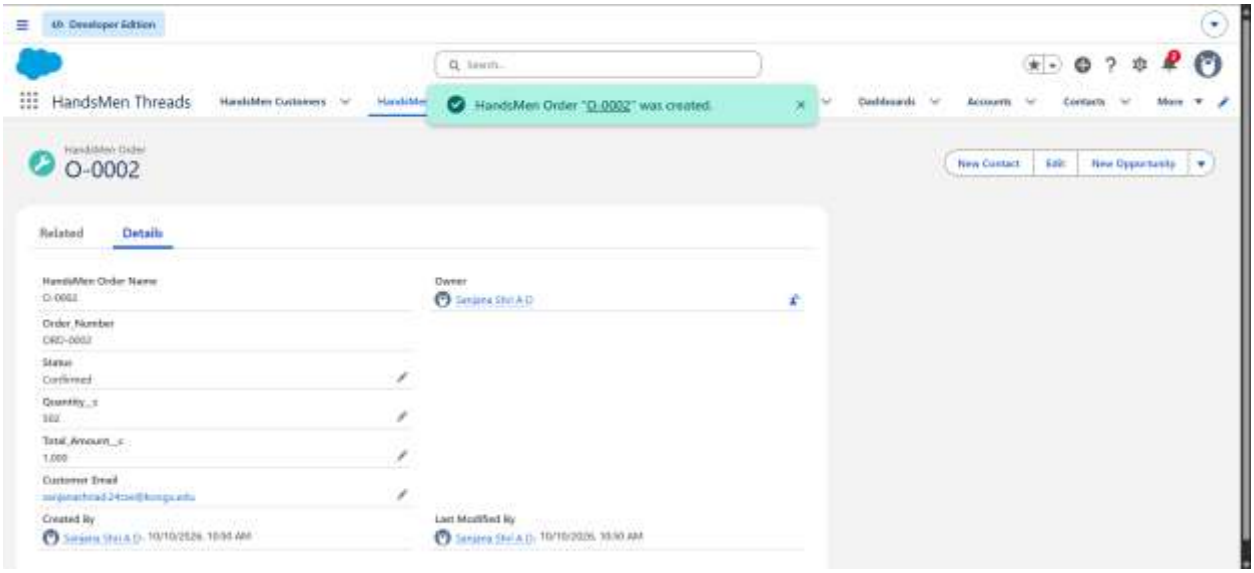

Key steps:

- Go to **Setup → Apex Classes → New**.

- Create the Apex class needed.
- Define the methods for business operations that are required.
- Where required, make use of Salesforce Objects, SOQL, and DML.
- Include error handling that is appropriate.
- Save and compile the class.
- Try out the Apex logic on sample records.

```
public class OrderTriggerHandler {
    public static void validateOrderQuantity(List<HandsMen_Order__c> orderList) {
        for (HandsMen_Order__c order : orderList) {
            if (order.Status__c == 'Confirmed') {
                if (order.Quantity_c__c == null || order.Quantity_c__c <= 500) {
                    order.addError('For Status "Confirmed", Quantity must be more than 500.');
                }
            } else if (order.Status__c == 'Pending') {
                if (order.Quantity_c__c == null || order.Quantity_c__c <= 200) {
                    order.addError('For Status "Pending", Quantity must be more than 200.');
                }
            } else if (order.Status__c == 'Rejection') {
                if (order.Quantity_c__c == null || order.Quantity_c__c != 0) {
                    order.addError('For Status "Rejection", Quantity must be 0.');
                }
            }
        }
```

Milestone 12: Batch Jobs – Create Batch Apex

Definition:
Batch Apex handles large numbers of Salesforce records efficiently by working through them in smaller groups. It is handy for scheduled bulk order processing and for related updates to inventory or the business.

Key steps:

- Create a Batch Apex class that implements the Database.Batchable interface.
- Define the **start, execute, and finish** methods.
- Retrieve the records needed with SOQL.
- Process records in batches.
- Make the updates to orders, inventory, or the business that are required.
- Execute the batch job.
- Monitor the job through **Setup → Apex Jobs**.
- Try the batch process out on sample records.

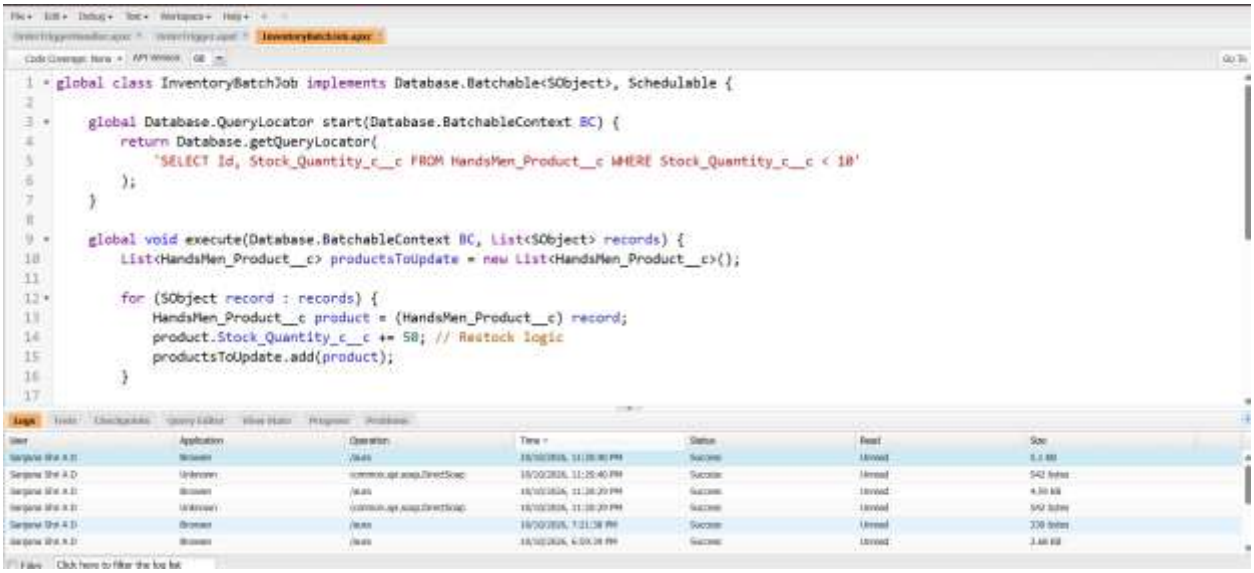

```
global class InventoryBatchJob implements Database.Batchable<SObject>, Schedulable {

    global Database.QueryLocator start(Database.BatchableContext BC) {
        return Database.getQueryLocator(
            'SELECT Id, Stock_Quantity_c__c FROM HandsMen_Product__c WHERE Stock_Quantity_c__c < 10'
        );
    }

    global void execute(Database.BatchableContext BC, List<SObject> records) {
        List<HandsMen_Product__c> productsToUpdate = new List<HandsMen_Product__c>();

        for (SObject record : records) {
            HandsMen_Product__c product = (HandsMen_Product__c) record;
            product.Stock_Quantity_c__c += 50; // Restock logic
            productsToUpdate.add(product);
        }
```

```
global class InventoryBatchJob implements Database.Batchable<SObject>, Schedulable {

    global Database.QueryLocator start(Database.BatchableContext BC) {
        return Database.getQueryLocator(
            'SELECT Id, Stock_Quantity_c__c FROM HandsMen_Product__c WHERE Stock_Quantity_c__c < 10'
        );
    }

    global void execute(Database.BatchableContext BC, List<SObject> records) {
        List<HandsMen_Product__c> productsToUpdate = new List<HandsMen_Product__c>();

        for (SObject record : records) {
            HandsMen_Product__c product = (HandsMen_Product__c) record;
            product.Stock_Quantity_c__c += 50; // Restock logic
            productsToUpdate.add(product);
        }
```

Milestone 13: Conclusion

Project Summary

A centralized platform for managing customers, products, orders, inventory, loyalty activities, and marketing information is what the HandsMen Threads Salesforce system offers. Salesforce automation lessens repetitive work and lets the organization manage daily business processes more efficiently.

Outcomes and Benefits

- **Efficiency:** Automation lessens repetitive manual activities.
- **Accuracy:** Validation rules help stop data that is incorrect or incomplete.

- **Faster Communication:** Automated emails give updates on orders and stock in good time.
- **Inventory Management:** Conditions of low stock can be identified and communicated fast.
- **Customer Engagement:** Information on loyalty and customers can be managed from a central place.
- **Better Visibility:** Managers are helped by reports and dashboards to monitor business activities.
- **Security:** Salesforce security features decide who gets access to business information.
- **Scalability:** More and more customers, products, orders, and users can be supported by the solution.

Possible Future Enhancements

- A portal that lets customers order online and track their orders.
- Mobile access for the sales team and the warehouse team.
- Sales and inventory analytics of an advanced kind.
- Payment gateway integration.
- Integration with delivery and logistics.
- Product recommendations and demand forecasting that use AI.
